

How to convert the rhel 9.0 to 10.2 version :

1. Go to: <https://developers.redhat.com>

2. Click "Join Red Hat Developer" → sign up free

3. On your VM:

Register the system

- `sudo subscription-manager register --username=your_rh_email --password=password`

Auto-attach subscription

- `sudo subscription-manager attach --auto`

Now you can run updates and Leapp

- `sudo dnf update -y`

#Then we need to reboot the status

- Sudo reboot

#After reboot — Confirm the version

- `Cat /etc/redhat-release`

#Before upgrading it to version 10 make sure this is installed

- `sudo subscription-manager repos --enable=rhel-9-for-x86_64-appstream-rpms`
- `sudo dnf install -y leapp-upgrade`

#install this libraries

- `sudo subscription-manager repos \`
- `--enable=rhel-9-for-x86_64-baseos-rpms \`
- `--enable=rhel-9-for-x86_64-appstream-rpms`

#Update the system

- Sudo dnf update -y

#reboot the system

- Sudo reboot

#after reboot check the version

- `cat /etc/redhat-release`

#upgrade the leap

- **sudo dnf install -y leapp-upgrade**

#must -step

#Run the pre-upgrade analysis

- **sudo leapp preupgrade**

This takes a few minutes. It will scan your system and produce a report of any inhibitors (blockers) that must be fixed before the upgrade can proceed.

#if the inhibitors are 0 which means that we can upgrade it to version 10

#Now upgrade to the version 10

- **sudo leapp upgrade**

#to check the version if it was to 10.2

cat /etc/redhat-release
